

NATIVE SPECIES SEED

The Native Species Program was established in 1994 and is unique among the programs of Iowa Crop Improvement Association (ICIA). The program has grown significantly since its conception, from 10 species in 1994 to over 150 species in 2009.

Although ICIA directs the inspection and certification, several other organizations have contributed significantly to the development and direction of the program. Among these are:

Tallgrass Prairie Center, University of Northern Iowa
Living Roadway Trust Fund, Iowa Department of Transportation
USDA-NRCS, Iowa office
USDA-NRCS Elsberry Plant Materials Center

Certification of native seeds is not a unique program to ICIA. As a member of the Association of Official Seed Certifying Agencies (AOSCA), ICIA joins many other states who offer the certification of native grasses, forbs, and woody plants under a common set of guidelines and requirements set by AOSCA. AOSCA offers three Pre-Variety Germplasm categories of Tested, Selected, and Source Identified class as an alternative to formal variety release. They are defined as follows:

Source Identified-Class of propagating materials collected from natural stands, seed production areas, seed fields, or orchards where no selection or testing of the parent population has been conducted.

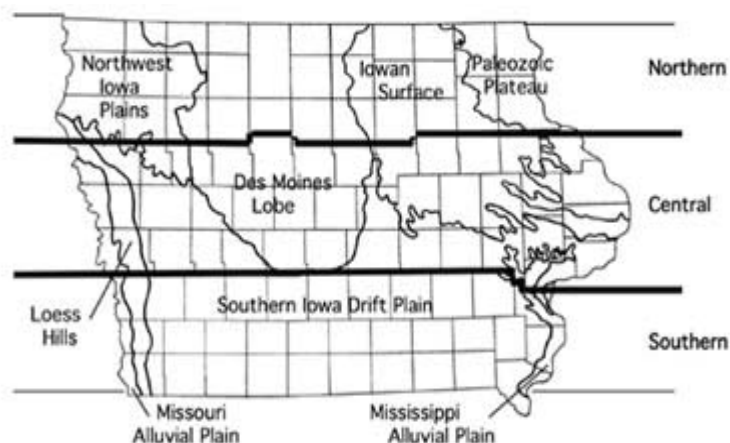

Selected-Class of propagating materials that shall be the progeny of phenotypically selected plants of untested parentage that have promise but no proof of genetic superiority or distinctive traits.

Tested-Class of propagating materials that shall be the progeny of plants whose parentage has been tested and has proven genetic superiority or possesses distinctive traits for which the heritability is stable, as defined by the certifying agency, but for which a variety has not been named or released. This seed must be produced so as to assure genetic purity and identity.

Most of the seed produced in the Native Species Program is of the Source Identified class. Selected Class seed is also in the program. The species listed in the following pages are identified as SID for Source Identified class and SEL for Selected class under the heading **Class**.

Seed sold as Source Identified class is comprised of two components: seed collected privately and seed collected for the Iowa Ecotype Project. The following two paragraphs will describe the components of the program. As noted previously, all of the seed certified as Source Identified class has been collected from native sites. These collection sites are remnants of the vast prairie that once covered the Midwest.

The biggest component of seed certified as Source Identified class is that which is privately collected. Hours of work go into locating and identifying a native site, receiving approval for the collection of seed, and then the harvest and cleaning of seed. Typically, another season or more is required to increase the seed to a marketable quantity. An applicant applying for certification of privately collected seed is required to submit germplasm collection documentation. This form of documentation identifies and describes the specific location from which the seed was collected. An ICIA inspector checks the site to verify that it is "native". The privately collected species listed on the following pages are identified under the heading **Source** as Private and **State** indicates the state where the seed collection was taken.

Iowa Ecotype Project seed provenance zones. Currently the Loess Hills are excluded from the Project. Growers may produce seed anywhere in Iowa or within one county of it's borders.

The second component of seed in the program is part of the Tallgrass Prairie Center's Iowa Ecotype Project. The Iowa Ecotype Project, which began in 1990, is funded in part by the Iowa Department of Transportation's Living Roadway Trust Fund. Its purpose is to provide regionally adapted and genetically diverse foundation seed. For the purposes of this project, Iowa is divided into three regions, north to south, with about three tiers of counties in each region. Parent seed is collected from Iowa remnant prairie communities in each of these regions, and initially increased at the Tallgrass Prairie Center, with some species

increased at the regional USDA-NRCS Plant Materials Center in Elsberry, MO. The seed is subsequently released to qualified native seed growers in or near Iowa. When applying for certification, seed growers receiving and planting this seed submit a tag they receive from the Tallgrass Prairie Center to document the origin of the seed and the region in which it was collected. The seed in the Iowa Ecotype Project is identified on the following pages under heading **Source** according to the region in which it was collected.

For more information about the Iowa Ecotype Project, contact Greg Houseal at 319-273-3005 or gregory.houseal@uni.edu
